

## Description

I as a hotel marketing employee want the price of my offer email always to be shown underneath the room picture so that it's better visible for the guest & so that the email is better structured.

## Background Info

- in the folder that was shared with you, you can find an html file 'Group Offer Sparkpost'
- this html is written with Sparkpost Language (more information here: <https://developers.sparkpost.com/api/template-language/>)
- currently the html shows the price next to the meal plan description (see screenshot as example)
- our customer (the hotel) wants to show the price underneath the room picture (see screenshot 'expected structure' for reference)

## Sparkpost

- to be able to render a preview in Sparkpost, please create a (free) Sparkpost Account here (do NOT select Sparkpost EU): <https://app.sparkpost.com/join> (as 'Company' is mandatory, just add 'Test Company')
- then use the already existing 'Get started using SparkPost' Template in your new account (or click here: <https://app.sparkpost.com/templates/edit/my-first-email/draft/content>) and replace the HTML with the 'Group Offer Sparkpost' HTML
- you will see an error like "Error while rendering part html: line 1039: substitution value 'context' did not exist or was null"
- to solve this: Switch to "Test Data" Tab in your Sparkpost Template
- you already see an empty json here with an empty object for "substitution\_data"
- you find different jsons in the 'json Examples' folder - add one of this json as "substitution\_data"
- after waiting a bit you should see a preview on the right side in your Sparkpost Template

## Your task

- the Group Offer looks different if the meal plan is 'global' (meaning 1 meal plan counts for the whole offer) or if the meal plan is 'per room type' (meaning every room has a different meal plan)
- when the meal plan is per room type, the price is shown next to the meal plan (like in the screenshot described above)
- when the meal plan is global the price is shown underneath the room picture (which is

correct)

- your task is now to align these 2 variants so that the price is always shown underneath the room picture no matter if the meal plan is 'global' or 'per room type'
- there are also 2 different versions of how the price is calculated
  - "rooms2" basically means, that the price is entered per night & a table is shown (see Screenshot 'Rooms2 Example')
  - "rooms" stands for a total price that is entered for the whole room for all nights
- the meal plan type (global/per room type) is defined by the key 'plugin\_data.entry.Group.AddMealPlanPerRoomType' (if its true = per room type | if its false = global)
- you need to adjust the parts on line 1429 - 1529 which is the view for 'rooms2'
- and 1875 - 1958 which is the view for 'rooms'
- you don't need to change any keys, the only thing that should be changed is the structure so that price is shown underneath the room picture & the meal plan underneath (for 'plugin\_data.entry.Group.AddMealPlanPerRoomType' = true)
- whereas the structure for 'plugin\_data.entry.Group.AddMealPlanPerRoomType' = false is already correct and should stay that way
- that means for the jsons: the 'meal plan global' examples are already correct (for rooms and rooms2), the 'meal plan per room type' examples should look different (for rooms and rooms2)

Feel free to use whatever tools you need and like.
